### **CLAIM FOR PRIORITY AND SUBMISSION OF DOCUMENTS**

Commissioner for Patents P.O. Box 1450 Alexandria, VA 22313-1450

Dear Sir:

Applicant hereby claims priority under 35 U.S.C. 119 based on the following prior foreign application filed in the following foreign country on the date indicated:

Date Country Application No. PA 2001 00684 May 1, 2001 Denmark

In support of this claim, a certified copy of the original foreign application is filed herewith.

Dated: September 12, 2005

Respectfully submitted,

Jav P. Kessler

Régistration No.: 41,151 DARBY & DARBY P.C.

#### The use of enantiomeric pure escitalopram

The present invention relates to the use of enantiomeric pure escitalopram (INN-name) which is the S-enantiomer of the well-known antidepresssant drug citalopram, i.e. (S)-1-[3-(dimethylamino)propyl]-1-(4-fluorophenyl)-1,3-dihydro-5-isobenzofurancarbonitrile, or a pharmaceutically acceptable salt thereof for the preparation of medicaments, in particular medicaments for the treatment of major depression disorder.

#### 10 Background of the Invention

Selective serotonin reuptake inhibitors (hereinafter called SSRIs) such as citalopram have become first-choice therapeutics in the treatment of depression, certain forms of anxiety and social phobias, because they are effective, well-tolerated and have a favourable safety profile compared to the classic tricyclic antidepressants.

However, clinical studies on depression and anxiety disorders indicate that non-response or resistance to SSRIs, i.e. where at least a 40-60% reduction in symptoms has not been achieved during the first 6 weeks of treatment, is substantial, up to 30%.

Moreover, there is the delay in therapeutic effect of SSRIs. Sometimes symptoms even worsen during the first weeks of treatment. Even in responders to SSRIs, several weeks of treatment are necessary to achieve a relief in symptoms.

In addition, sexual dysfunction is a side-effect common to all SSRIs. Without addressing these problems, real progress in the pharmacotherapy of depression and anxiety disorders is not likely to happen.

Escitalopram is the S-enantiomer of the well-known antidepressant drug citalopram and has the following structure:

Formula I

Escitalopram and a method for its preparation are disclosed in US Patent No 4,943,590. The stereo selectivity of citalopram, i.e. the 5-HT-reuptake inhibition in the S-enantiomer, and accordingly, its potential antidepressant effect of said enantiomer is also disclosed. It appears that substantially all the 5-HT-reuptake inhibiting effect is in the S-enantiomer and, accordingly, that escitalopram is two times as potent as the racemate.

It has now, surprisingly, been found that the presence of R-citalopram has a negative impact on the effect of escitalopram and escitalopram has been found in pharmacological and clinical studies to be substantially more than two times as potent as the racemate.

Furthermore, escitalopram has been found to show a faster onset of action in animal models and clinical studies than the racemate and other SSRI's and to give a more full response in various animal models. Finally, clinical studies have indicated that escitalopram may be an effective medicament in the treatment of depression in patients that do not respond to conventional SSRI's.

The mechanism behind the surprising negative impact of the R-enantiomer on the effect of the S-enantiomer is not known. One possible explanation could be that R-citalopram may have a negative influence on the transport of S-citalopram over the blood brain barrier.

#### Description of the invention

Accordingly, the present invention thus relates to the use of escitalopram comprising less than 3 % w/w of R-citalopram for the preparation of a pharmaceutical composition.

In a further aspect, the invention relates to a pharmaceutical composition characterised in that it comprises escitalopram with less than 3 % w/w of R-citalopram as an active ingredient.

25

20

30

In yet another aspect, the invention relates to the use of escitalopram for the treatment of major depression disorder characterised in that it is used in a daily dose of less than 10 mg of escitalopram.

- As mentioned above, the present invention is based on the finding that R-citalopram has a negative impact on the effect on escitalopram. This may be shown in functional in-vivo pharmacological models and studies of 5-HT-reuptake effect and or in behaviour models, for example depression models.
- 10 Escitalopram has also been found to give a significant improvement compared to the double amount of citalopram-racemate and/or to give a more full. So, it has been found in fixed dose studies that escitalopram in a dose of 10 mg has at least same effect as citalopram in a dose of 40 mg as determined by the MADRS rating scale and Clinical Global Impression (severity as well as improvement).

Escitalopram has also been found in animal models to give a faster response than citalopram-racemate. This has i.a. been found in the Chronic Mild Stress model (Willner P., Psychopharmachology 1997, 134, 319-329). This effect has been confirmed in an 8-week, double-blind, randomised, placebo-controlled, flexible-dose study that compared escitalopram and citalopram to placebo in primary care patients with major depression disorder. The patients received 10 mg escitalopram (155 patients), 20 mg citalopram (160 patients) and placebo (154 patients). Escitalopram showed effects after one week whereas citalopram did not show significant effect.

The escitalopram used in the various studies and showing these effects is escitalopram comprising less than 3 % w/w R-citalopram, in most cases between 2 or 1 and 0.5 %.

All these effects are very surprising in view of the prior art suggesting that the R-enantiomer does not influence the effect of the S-enantiomer and, accordingly that escitalopram should only be twice as potent as the racemate.

As a further advantage, the fact that escitalopram is effective in lower doses suggests that effective treatment with less side effects may be obtained, in particular, a reduced amount of

10

15

4

serotonin reuptake inhibitor may reduce the risk of SSRI-induced sexual dysfunction and sleep disturbances.

#### Detailed description of the invention

The escitalopram is preferably used as an oxalate salt, preferably a crystalline oxalate salt.

Furthermore, in the citalopram used, R-citalopram is preferably not present in an amount exceeding 2 % w/w, most preferably 1 % w/w. It has turned out that a small amount of R-citalopram may conveniently be present and, accordingly, R-citalopram may conveniently be present in an amount of up to 0.5 %. The percentage of R-citalopram is throughout the description given as w/w % compared to the amount of escitalopram present.

The pharmaceutical composition of the invention is preferably for the treatment of depression, in particular major depression disorder, neurotic disorders, acute stress disorder, eating disorders such as bulimia, anorexia and obesity, phobias, dysthymia, premenstrual syndrome, cognitive disorders, impulse control disorders, attention deficit hyperactivity disorder or drug abuse.

- Throughout this specification and claims the term "neurotic disorders" is used to designate a group of mental disorders, including anxiety states, in particular generalised anxiety disorder and social anxiety disorder, post traumatic stress disorder, obsessive compulsive disorder and panic attacks.
- The terms "generalised anxiety disorder", "social anxiety disorder", "post traumatic stress disorder" and "obsessive compulsive disorder" are as defined in DSM IV.

The phrase "panic attacks" contemplates treatment of any disease, which is associated with panic attacks including panic disorder, specific phobias, social phobia and agoraphobia in which panic attacks occur. These disorders are further defined in the DSM IV.

The phrase "treatment of panic disorder" means a reduction in the number or prevention of attacks and/or relief of the severity of the attacks. Similarly, the treatment of generalised

anxiety disorder, social anxiety disorder, post traumatic stress disorder and obsessive compulsive disorder include the treatment or prevention of these diseases, or the relief of the symptoms thereof.

Based on the pharmacological and clinical studies, preferred indications are major depression disorder and obsessive compulsive disorder.

Other preferred uses are treatment of neurotic disorders.

In particular, the composition may be useful for treatment of patients who have failed to respond to initial treatment with a conventional SSRI, in particular patients with major depression disorder who have failed to respond to initial treatment with a conventional SSRI, i.e. patients who do not achieve an alleviation in symptoms of 40-60 % by treatment with citalopram or other marketed SSRI's.

15

The pharmaceutical composition according to the invention may comprise escitalopram in a unit dose preparation containing 2.5 to 20 mg escitalopram.

In view of the potent effect of the escitalopram used according to the invention, it may be effective in low doses, i.e. daily doses lower than 10 mg escitalopram, for example 7.5 mg or lower, such as 7.5 or 5 mg pr day.

The pharmaceutical composition according to the invention is preferably an oral formulation, preferably a tablet.

25

30

Thus, tablets may be prepared by mixing the active ingredient with ordinary adjuvants and/or diluents and subsequently compressing the mixture in a conventional tabletting machine. Examples of adjuvants or diluents comprise: corn starch, potato starch, talcum, magnesium stearate, gelatine, lactose, gums, and the like. Any other adjuvants or additives usually used for such purposes such as colourings, flavourings, preservatives etc. may be used provided that they are compatible with the active ingredients.

DOR

01/05/2001

6

Solutions for injections may be prepared by dissolving the active ingredient and possible additives in a part of the solvent for injection, preferably sterile water, adjusting the solution to desired volume, sterilisation of the solution and filling in suitable ampules or vials. Any suitable additive conventionally used in the art may be added, such as tonicity agents, preservatives, antioxidants, etc.

#### Clinical Study

A total of 471 patients were randomised into the study. The all-patient-treated set comprised 10 469 patients and the full-analysis set comprised 468 patients. In the full-analysis set there were 155 patients in the escitalopram group, 159 patients in the citalopram group, and 154 patients in the placebo group.

There was an approximately 3 to 1 ratio of women to men in each treatment group, and almost all patients were Caucasian. The mean age was 43 years (SD 11). At baseline, the mean MADRS total score was approximately 29 for the treatment group, which signifies moderate to severely ill patients.

The efficacy analysis of the adjusted mean change in MADRS total score showed a significantly superior therapeutic effect for escitalopram versus placebo from Week 1 (p=0.023) to Week 4(p=0.002) )(observed cases). At Week 4, the adjusted mean change in MADRS total score (last observation carried forward) for escitalopram versus placebo was 2.7 points >(p=0.002) compared to a statistically insignificant change of 1.5 points for citalogram versus placebo.

25

30

15

20

Escitalopram was significantly superior to placebo both on the CGI improvement and severety subscale from Week 1 (p<0.05)(observed cases) onwards, while citalogram was not statistically different from placebo during the 4-week period. At Week 4 (last obsrvation carried forward), escitalopram was statistically significantly superior to placebo while there was no statistically significant difference between citalopram versus placebo.

#### **CLAIMS**

1. Use of escitalopram comprising less than 3 % w/w of R-citalopram for the preparation of a pharmaceutical composition.

5

- 2. The use according to claim 1 characterised in that escitalopram is used as an oxalate salt, preferably a crystalline oxalate salt.
- 3. The use according to claim 1 or 2 characterised in that escitalopram comprising not more than 2 % w/w R-citalopram is used.
  - 4. The use according to claim 3 characterised in that escitalopram comprising not more than 1 % w/w, preferably between 0.5 and 1 % w/w R-citalopram is used.
- The use according to any of Claims 1 4 characterised in that the pharmaceutical composition is for treatment of depression, in particular major depression disorder, neurotic disorders, acute stress disorder, eating disorders such as bulimia, anorexia and obesity, phobias, dysthymia, premenstrual syndrome, cognitive disorders, impulse control disorders, attention deficit hyperactivity disorder or drug abuse.

20

- 6. The use according to Claim 5 characterised in that the pharmaceutical composition is for treatment of major depression disorder.
- 7. The use according to Claim 5 characterised in that the medicament is for treatment of a neurotic disorder.
  - 8. The use according to any of Claims 5 to 7 characterised in that the pharmaceutical composition is for treatment of patients who have failed to respond to initial treatment with a conventional SSRI.

30

The use according to Claims 8 characterised in that the pharmaceutical composition is for treatment of patients with major depression disorder who have failed to

15

30

respond to initial treatment with a conventional SSRI.

- 10. Pharmaceutical composition, characterised in that it comprises escitalopram with less than 3 % w/w of R-citalopram as an active ingredient.
- 11. Pharmaceutical composition of claim 10, characterised in that it comprises escitalopram with not more than 2 % w/w of R-citalopram as an active ingredient.
- Pharmaceutical composition according to claim 11, characterised in that it comprises escitalopram with not more than 1 % w/w preferably between 0.5 and 1 % w/w R-citalopram.
  - 13. Pharmaceutical composition according to any of claims 10 to 12 characterised in that it is a unit dose preparation containing 2.5 to 20 mg escitalopram.
  - 14. Pharmaceutical composition according to claim 13 characterised in that it is a unit dose preparation containing not more than 10 mg escitalopram.
- Pharmaceutical composition according to claim 14 characterised in that it is a unit dose preparation containing not more than 7.5 mg escitalopram.
  - 16. Pharmaceutical composition according to any of claims 10 to 15 characterised in that it is a oral formulation, preferably a tablet.
- Use of escitalopram for the treatment of major depression disorder characterised in that it is used in a daily dose of less than 10 mg of escitalopram.
  - 18. Use of escitalopram for the treatment of major depression disorder characterised in that it is used in a daily dose of 7.5 mg or less of escitalopram.
